

CRUD Notification System

Objective:

The objective of this is to develop a simple CRUD (Create, Read, Update, Delete) notification system using NestJS and MongoDB.

Requirements:

- The system should allow the user to create a notification with a title, message, and date/time.
- The system should allow the user to view a list of notifications, including the title, message, and date/time.
- The system should allow the user to update an existing notification's title, message, and/or date/time.
- The system should allow the user to delete a notification.

Nice-to-Have:

- Frontend: Develop a frontend using any framework. Recommended to use Angular.
- Authentication: Implement a simple authentication system that requires the user to log in before using the notification system.
- Search: Allow the user to search for notifications by title or message.
- Sorting: Allow the user to sort notifications by date/time or title.
- Responsive Design: Make the frontend responsive so that it works well on different screen sizes.
- Version Control: Use Git for version control to keep track of changes made to the code.
- Docker: Use Docker to containerize the application, making it easier to build, package, and deploy, and to simplify the development workflow.

Tech Stack:

Backend : NestJS

Database : MongoDB

Frontend : Angular (recommended)

Deliverables:

You should deliver a working notification system that meets the requirements listed above. The deliverables may include:

- The source code of the system.
- Documentation that explains the technology used, how to set up and run the system, the design choices made, and any challenges faced during development.

Tutorials:

You can learn by consulting several web tutorials and references. Here are some ideas we discovered:
